P008 School Facilitation of Student Involvement in Educational Planning and Selfdetermination

Wendy Cavendish and Deborah Perez (Department of Teaching and Learning, University of Miami)

Abstract

Student involvement in educational planning and the development of self-determination skills are both linked to improved school outcomes for students with Learning Disabilities (LD). This study examined student and teacher perceptions of student involvement in IEP planning in two urban high schools and the relationship of level of involvement to self-determination for students with LD. Rasch measure scores on both student and teacher Student Involvement Surveys (SIS) revealed differences between teacher and student perceptions of school efforts to involve students. We also examined the relationship between level of facilitation of student involvement and selfdetermination for the 34 high school students. Implications for school practice are discussed.

F4

P013 The Role of Anxiety in Self-Concept and Inattentive Symptomatology of ADHD

Laura M. Cañamero, Natalia Martín, Zara Suárez-García, Marisol Cueli, Débora Areces (Department of Psychology, University of Oviedo)

Abstract

Attention-deficit/hyperactivity disorder (ADHD) has been associated with low self-concept. The present work examined the effect of inattentive symptomatology on emotional, social, physical and academic self-concept, attending to the mediation and moderation of anxiety. A total of 167 students (70.7% boys and 29.3% girls) aged between 11 and 16 years participated in this study. The results suggest that for the emotional, social and physical self-concept to decrease, when inattention increases, the role of anxiety must be considered. However, there is a direct effect of inattentive symptomatology on academic self-concept. This indicates that the greater the inattentive symptomatology ADHD-students show, the worse the perception they will have of their own academic capacity.
